

Is there **REALLY** an alternative to fiber...?

Yes
there is...

*because Microwave Bypass has put an end
to the wireless trade-offs!*

Now you can connect your LANs at *full speed* (10-45 megabits per second) and send voice and video too! Our radio links are completely transparent to your network and so reliable you may forget you have one - come rain, snow, sleet, fog or flock of birds.

Better still, you can forget about monthly leased line bills. Now you'll *own a lot more bandwidth* - for pennies on the dollar versus fiber!

Microwave Bypass is the pioneer and leader in full speed wireless networking. We've been delivering exceptional products and customer service - 24 hours a day - for over a decade. From system design, licensing, installation and maintenance; we do it all!

Now, what about all that "wireless" hype? It's mostly about cellular and messaging devices for the individual. Other technologies, like spread spectrum, offer network connectivity, but at very restricted data rates - *far below LAN speeds*. Then there are gizmos like laser and infrared, which are great for indoor use, but depend on clear visibility for a reliable outdoor connection.

But thankfully, not all wireless is the same. Only microwave gives you the greatest combination of speed and reliability. *That's a fact...* and we prove it every day with installations at many of the world's leading universities, corporations and medical centers.

If you need to connect networks across the street or up to twenty miles away, we can do the same for you!
