Is there really an alternative to fiber...?

GUARANTEED
Celebrating 10 Years
as the Pioneer & Leader
PERFORMANCE!

First, forget compromises! A *real* alternative to fiber has to handle **full** network speeds (10-45 megabits per second). It should also support voice traffic and broadcast quality video. And most of all, it would have to be so reliable that you'd forget it's there - rain, snow, sleet, fog or flock of birds.

What else? How about putting an end to monthly leased line charges and **owning** a lot more bandwidth - all for pennies on the dollar?

You can have all this and *more* with **Microwave Bypass**... The "more" is the peace of mind you enjoy by knowing you're with the pioneer and leader in full speed wireless networking.

We've been delivering exceptional products and customer service - 24 hours a day - for more than a decade. We'll be happy to send you trade journal and customer references and let them do the talking.

Now, what about all that "wireless" hype? Most of it is about portability for single user devices, not networks. Other wireless gizmos, like laser and infrared, are designed to connect networks, but require *clear air* for a reliable connection.

But thankfully, not all wireless is the same. Only microwave gives you the greatest combination of speed and reliability. **That's a fact...** and we prove it every day with installations at many of the world's leading universities, medical centers and corporations.

If you need to connect networks across the street or up to twenty miles away, we can do the same for you!
